POWDER EXTRACTION SYSTEMS

P-ABS Ideal for HDM SM/CD 102 or R700

Grafix powder extraction systems can be retrofitted to most sheet fed presses.

Powder Extraction systems reduce machine wear. Extend cleaning intervals by extracting any surplus powder immediately after the dry spraying action. Measurements have shown that most of the swirled powder volume can be removed from the press. Hygiene conditions on the shop floor improve markedly and it becomes easier to comply with workplace policies. The units are designed for easy operation and the filter element is easily accessible.

Extraction channels are fitted to the delivery of the press, a blower sucks the air through aspiration mouth tangentially into the filter cabinet. This cyclone effect extracts up to 80% of the spray powder. The rest is removed from the air by one or more filter elements.

POWDER EXTRACTION SYSTEMS

Two types of extraction system are available. P-ABS is shown on the previous page is ideal for cleaning up larger format presses, or half size presses where a high volume of powder is used. The 2101R shown below cleans up those half size presses, ideal for the Komori L26/28, HDM74 and the Ryobi 750.
